BackOffice Associates® Solutions

Release Notes

Version 6.5.1

Software Release Date: 05/04/2016

Table of Contents

Introduction

This document describes the enhancements and resolved issues included in the 6.5.1 version of BackOffice Associates® Solutions.

NOTE: Due to the changes in the naming of the Data Services objects (datastores, jobs and data flows) to improve the integration of the DSP™ and Data Services, the Collect Packages using Data Services as the package type (both RFC and standard) **must be rebuilt** from Collect in the DSP™ application.

Enhancements

dspMigrate™

Target Design

When a lookup table is registered in Target Design, it is registered as a source table with a status of Documentation and a rule priority offset of 50000 so that it is sorted last. Documentation sources are not processed but are a reference item to see all the sources of data.

Map

An Update Row source that is a table can now be added. Rules can be created for this Update Row source table which convert the data before it is processed by the main source rule. The table can also be used as a snapshot of data for results validation. Refer to "Add Update Row Sources that are Tables" in the online help for more information.

Data Stewardship Platform (DSP™)

Online Help

A glossary has been added.

dspGovern™

- A category language workflow message can be disabled if the message is not to be sent or if the message must be replaced with a custom message. The Content WebApp must provide all code to process custom messages. Refer to "Edit Category Language-specific Messages" in the online help for more information.

- The user can now reject a request using the Review Workbench. Refer to "Reject a Request" in the online help for more information.

- A Designer can include additional columns along with the key fields in the Key to Record field on the *Review Role Audit Details* page. These columns can provide additional information to assist the Review role when evaluating changes in a request. Refer to "Register Tables and Columns to be Audited in dspGovern™" for more information.

- A DBMoto package can now be used during the Final Finish Process. Refer to "Configure Data Download During the Final Finish Process to use a DBMoto Package" in the online help for more information.

- dspGovern™ can now be configured to send summary workflow messages. Refer to "Set up SLA Notifications in dspGovern™" in the online help for more information.

Resolved Issues

dspMigrate™

Transform

- An issue occurred where the segmented reports displayed the total record count for the report as if it was not segmented. With this fix, each of the segmented reports display the record count for the individual report.[DSP-6035]

- An error occurred when special characters were used in segmented reports. The report would not save, validate or run successfully. With this fix, the report runs successfully. [DSP-6505]

- An error occurred when attempting to execute the Source Rule in Transform due to the EscapeObjectName function used by the framework. With this fix, the Source Rule executes without error. [DSP-6523]

Data Stewardship Platform (DSP™)

Collect

Fixed an issue in Collect which affected Oracle replications in DBMoto®. [DSP-6741]

System Administration

The issue of an exception being thrown during an Excel file upload when the drill down criteria contained a column which did not exist on the underlying table for the page has been fixed. [DCR-576]
