Select Provider Screen	. 2
Set Connection String Screen	. 3

Syniti Replicate allows you to replicate data from relational database tables to **Vertica Analytics Platform** in the following ways:

• Refresh (Snapshot replication)

A one-time complete replication from any major relational database source to **Vertica** as a target, according to replication settings and scripts. You can control the timing of the replication, identify the columns to be replicated and add scripts to transform data during replication. Source databases include Oracle, Microsoft SQL Server, IBM Db2 for i, IBM Db2 LUW, Sybase, Informix, MySQL.

Continuous refresh

A regularly scheduled refresh replication as described above. The schedule is defined in the replication settings.

One-way mirroring (Incremental Replication)

A continuous update of replicated tables based on changes to the source database that have been recorded in the database server log. Typically, this involves an initial refresh operation, as described above, to set up the target table. Then you can define the replication settings to check the transaction log on the source database at regular intervals. Any changes found in the log are applied to data on the **Vertica** platform.

For complete details on the setup process, check the *Syniti Replicate User Guide* available from the Management Center **Help** menu or the *Syniti Replicate Setup Guide*, available for download in the <u>Help Center</u>.

Connection Type

Vertica .NET Data Provider
